Team,

By now, everyone should be aware of the incredible scale of PHP's critical, unauthenticated remote code execution vulnerabilities (CVE-2026-109618 and CVE-2026-109619, CVSS 9.2). The impact across our industry can't be overstated – PHP powers nearly 70% of all websites globally, and with Cortex Xpanse we've already determined there are more than 22 million potentially exposed instances. This is exactly the kind of vulnerability customers need to address in the frontier AI era.

Traditional approaches won't help them here. The average enterprise takes ~55 days to deploy a patch, and 29% of vulnerabilities are weaponized within 24 hours of disclosure. Fortunately, ATP customers were protected on Day 1 of PHP's disclosure. Frontier Virtual Patching (FVP) customers had an even greater advantage, made possible by new vaulted coverage technology: they have been protected since October 20, before the details were public… with no downtime, restarts, or policy changes.

How you can help customers *now*: Ensure they understand their path to remediate the current risk, and how FVP can protect them pre-emptively before the next issue arises. To make this conversation even more urgent, you can now offer them a complimentary **30-day FVP trial (delivered as ATP Plus on software or hardware firewalls)**, effective between Oct 21 and Nov 30.

Steps to take immediately:

1. **Understand the issue and how to address questions:** Review the internal guidance
2. **Share our latest thought leadership,** to help customers formulate their strategy:
    - Lee's blog post with immediate remediation guidance
    - Unit 42's Threat Brief about PHP's CVEs
    - Anand's blog post on how FVP addresses the exposure gap
3. **Plan your FVP offer strategy:** Reach out to accounts on your current FVP pipeline first, then the EA, bundle, and ALC motions in your ATP accounts
4. **Prepare for the discussion:** Review the sales enablement deck for messaging, discovery questions, objection handling, and the offer (note the required steps to apply this offer)
5. **Set up quotes to convert ATP to ATP Plus:** This can be transacted through the ELA, ALC, and bundle (bundle SKUs available November 12) attach motions. See here for more details.

Be prepared: Questions about our CVE

As these conversations come up, you may get questions about whether our products are impacted by PHP's vulnerabilities. It's very important that you respond with approved talking points based on the Security Advisory and internal guidance. Use this opportunity to remind customers with exposed management interfaces to remediate their risk.

This won't be the last widespread vulnerability surfaced by frontier AI. Start the conversation today, and let's make FVP the security layer our customers rely on before the next one lands.

Please reach out to our GTM & Product teams or post your question in the #help-frontiervirtualpatching-atpplu Slack channel for customer presentations, demos, and pricing in your next steps.
